9 Parametric Equations and Polar Coordinates

Dr. Jeongho Ahn

Department of Mathematics & Statistics

ASU

Outline of Chapter 9

- Parametric Equations
- Calculus and Parametric equations
- Polar Coordinates
- Calculus in Polar Coordinates
- Conic Sections in Polar Coordinates

9.1 Parametric Equations

- When you consider a particle which moves along a curve, considering parametric equations is a better way to describe the curve.
- We suppose that x and y are both given as functions of a third variable t (parameter) by the Parametric Equations

$$x = f(t), \quad y = g(t)$$

Each parameter t determines a point (x,y) = (f(t),g(t)) which traces out a parameter curve C as t varies.

Example1

The following parametric equations

$$x(t) = t^2 - 3t$$
 $y(t) = t - 1$ for all real numbers t

will be the parabola (Cartesian equation) $x = y^2 - y - 2$.

ullet We can restrict $t\ (a \le t \le b)$ to consider parametric equations

$$x = f(t)$$
 $y = g(t)$ $a \le t \le b$,

where (f(a), g(a)) is an initial point and (f(b), g(b)) is a terminal point.

Example2

1. Find the curve represented by the following parametric equations

$$x = \cos t$$
 $y = \sin t$ $0 \le t \le 2\pi$.

2. Find the curve represented by the following parametric equations

$$x = 3\cos 4t$$
 $y = 3\sin 4t$ $0 \le t \le 2\pi$.

3. We can see that $(x-h)^2 + (y-k)^2 = r^2$ (the equation of circles) is equivalent to the following parametric equations

$$x = h + r \cos t$$
 $y = k + r \sin t$ $0 \le t \le 2\pi$.

Example3

Sketch the curve with the parametric equations

$$x = \cos t$$
 $y = \cos^2 t$

Example4

Eliminate the parameter to find a Cartesian equation of the curve.

- 1. x = 5t 3 y = 2t 1
- 2. $x = \sqrt{t}$ y = t 1
- 3. $x = e^{3t}$ y = t + 2 $t \ge -2$

Example5

Describe the motion of a particle with position (x, y) as t varies in the given interval

$$x = 1 + 2\cos t$$
 $y = -2 + 2\sin t$, $\pi/2 \le t \le 3\pi/2$
